

Script-Controlled ACL

- Restrict record access based on field value
- ServiceNow micro project

Problem

- Role-only ACLs expose sensitive critical incidents
- Roles cannot look at record data

Solution

- Advanced ACL with a server-side script
- Priority 1 incidents visible only to assignee, managers, admins

Design

- Read ACL on Incident [incident]
- Deny by default; decision matrix by priority and user

Implementation

- Custom role incident_manager and test users
- ACL script using gs.hasRole(), gs.getUserID(), current.priority

Testing

- Eight test cases using impersonation
- Manager, assignee, unrelated user, caller, admin, live priority change

Conclusion and Future Scope

- Precise record-level protection with little code
- Next: field-level ACLs and other tables
