

ACL Script

Script-Controlled ACL | ServiceNow Micro Project

Paste this into the Script field of the ACL record (Advanced checked).

```
// ACL: Incident [incident], operation: read, Advanced = true
// Rule: Priority 1 (Critical) incidents are visible only to admins,
// incident_manager role users, and the assigned user.

answer = false; // deny by default

var userId      = gs.getUserID();
var isManager   = gs.hasRole('admin') || gs.hasRole('incident_manager');
var isAssignee  = current.assigned_to == userId;
var isCaller    = current.caller_id == userId;

if (current.priority == 1) {
    // Critical incident: restricted
    answer = isManager || isAssignee;
} else {
    // Normal incident: standard access
    answer = gs.hasRole('itil') || isAssignee || isCaller;
}
```

How it works

- answer is the variable ServiceNow reads to allow (true) or deny (false) access.
- current is the incident record being checked.
- gs.getUserID() and gs.hasRole() identify the logged-in user and their roles.
- Priority 1 records use the strict rule; all other records use the normal rule.
