

ServiceNow ACL Configuration

Script-Controlled ACL | ServiceNow Micro Project

Step 1: Prepare roles and users

- Go to User Administration > Roles > New. Create the role incident_manager.
- Create three users: one with incident_manager, one with itil (assigned to a Priority 1 incident), one with itil only.
- Open your admin profile and select Elevate role > security_admin (needed to edit ACLs).

Step 2: Create the ACL

- Go to System Security > Access Control (ACL) > New.
- Type: record. Operation: read. Name: Incident [incident].
- Check Advanced. Leave the Roles list empty.
- Paste the script from ACL Script.pdf into the Script field.
- Click Submit.

Step 3: Verify

- Use Impersonate User to open a Priority 1 incident as each test user.
- Confirm the results match the decision matrix in ACL Design.pdf.
- Capture screenshots for the Implementation and Testing PDFs.

Note: field names (assigned_to, caller_id, priority) are standard Incident fields. Change them if your instance is customized.
