

ACL Design

Script-Controlled ACL | ServiceNow Micro Project

Use case: on the ServiceNow Incident table, records with Priority 1 - Critical are visible only to the assigned user, users with the incident_manager role, and admins. All other incidents follow normal access.

ACL definition

Property	Value
Type	record
Operation	read
Name	Incident [incident]
Advanced	Checked (script enabled)
Roles field	Left empty so the script makes the decision
Active	True

Decision matrix

Priority	Admin / incident_manager	Assigned user	Caller	Other itil user
1 - Critical	Allow	Allow	Deny	Deny
2 to 5	Allow	Allow	Allow	Allow

Logic in plain steps

- Start with answer = false (deny by default).
- If priority is 1: allow admin, incident_manager, or the assigned user.
- Otherwise: allow itil role users, the assigned user, or the caller.
