

System Architecture

Script-Controlled ACL | ServiceNow Micro Project

The ACL engine runs on the server for every request, before data reaches the user.

Layer	Responsibility
User	Requests an incident record using their role and identity
ServiceNow UI	Sends the request to the server
ACL engine	Finds matching ACL rules for the table, operation, and field
ACL script	Reads current.priority and the user's roles and returns true or false
Incident table	Returns the record only if the ACL answer is true
