

Brainstorming and Idea Prioritization

Script-Controlled ACL | ServiceNow Micro Project

Goal

Find a practical way to restrict access to individual ServiceNow records based on the value of a field, using a script-controlled Access Control List (ACL).

Ideas generated

#	Idea	Impact (1-5)	Effort (1-5)	Score (Impact - Effort)
1	Restrict Priority 1 incidents to assignee and managers using an ACL script	5	2	3
2	Restrict records by caller department field	4	4	0
3	Make Closed incidents read-only using a write ACL script	3	2	1
4	Hide sensitive fields (for example work notes) with field-level ACLs	4	3	1
5	Time-based access that opens records only during business hours	2	4	-2

Selected idea

Idea 1 has the highest score. It clearly demonstrates a scripted, field-value based ACL and is quick to build and test on a Personal Developer Instance.

Use case: on the ServiceNow Incident table, records with Priority 1 - Critical are visible only to the assigned user, users with the incident_manager role, and admins. All other incidents follow normal access.
