Script-Controlled ACL | ServiceNow Micro Project

Problem statement

Critical incidents can contain sensitive operational details. With role-only ACLs, every user with the itil role can open them, even when they are not involved. Role checks alone cannot look at what is inside a record.

Problem breakdown

Question	Answer
Who is affected?	Incident managers, fulfillers, and the security or compliance team
What is the problem?	Access is decided by role only, not by the record's field values
Where does it happen?	The Incident table in ServiceNow
Why does it matter?	Sensitive Priority 1 details may be seen by uninvolved users
Desired outcome	Access decided at run time from the Priority value and the user's relation to the record

How might we...

- ...allow access only when a field has a certain value and the user is involved?
- ...keep the rule readable and maintainable for administrators?
- ...avoid blocking users who legitimately need to work on the record?
